## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claims 1-5 are allowed.
2. The following is an examiner's statement of reasons for allowance: Claims 1-5 are allowed because prior art fails to teach or make obvious an imaging system for generating an image of a planar segment of an object, the imaging system comprising: an x-ray source that generates x-rays at first and second source points, and a controller that selects which of the source points generates the X-rays at any given time and that reads a first image formed by x-rays from the first source point and stored in a first portion of the photodetectors while a second portion of the photodetectors measures x-rays from the second source point to generate a second image that is stored in the second portion of the photodetectors as claimed in combination with all elements of claim 1. Claims 2-5 are allowed by virtue of their dependence.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### ***Response to Arguments***

3. Applicant's arguments, see pages 4-8, filed October 4, 2005, with respect to claims 1-5 have been fully considered and are persuasive. The rejection of claims 1-5 has been withdrawn.

### ***Conclusion***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Tuy et al. (US Patent 5,592,523) teaches the combination of scintillation crystal and photodetector array mounted to and preferably integral with an integrated circuit (26) having charge storage devices (32, 34). Electrical charge generated by each photodetector is integrated and stored alternately by a corresponding pair of charge storage devices. The charge storage devices operate as a double buffer in which one charge device accumulates charge while the other holds an accumulated charge until read out by downstream circuitry. The downstream circuitry includes a plurality of amplifiers (66) and an analog digital converter (62) integrally formed on the substrate (see abstract).
